Welcome to our presentation about drugs.

In the Netherlands, drugs are always a popular topic in the news.

In any other country, the Netherlands is seen as a cannabis paradise.

Therefore we thought it would be interesting to zoom in on the drugs topic and show some facts about drugs. The presentation will be about the three very popular drugs: cannabis, cocaine and xtc.

This is a map of Europe. It shows cannabis usage per country. What is surprising, is that the Dutch do not use a lot of cannabis compared to other European countries.

Now you see a map which shows cocaine usage per country. The English seem to be quite heavy cocaine users, compared to other European countries. However, Spanish are top of the list.

Lastly, this is a map showing xtc usage in Europe. Again, the English are fond of their drugs, showing a large percentage of xtc users, compared to other countries. Also, the Czechs are heavy xtc users.

This is a special graph, called a radar chart. It shows the drugs usage across different age groups.

Now, this table shows the comparison of drugs usage between males and females. What is surprising, is that males always use more drugs than females.

This is our last graph. It shows a comparison of drugs usage among different income groups, divided in quintiles. One may expect that cocaine is used mainly across high income groups, but this is not true. The highest usage was among the lowest income group

Conclusion:

Our presentation has shown quite a lot of information on cannabis, cocaine and xtc usage. We hope that we have provided you with some extra knowledge on drugs.
